Keywords: FTP Backup Plesk

If you have FTP Backup enabled on your dedicated server, you can use Plesk to automatically back up your domains. First, you need to specify your FTP server settings in Plesk, and then you can schedule automated backups. To Configure Your FTP Server Settings in Plesk Log in to Plesk as administrator. On the Domain administration page for the domain you want to back up, click the **Backup** icon. Click the **FTP Account Properties** icon. In the **FTP server** field, type in the IP address for your FTP Backup server. Type in the user name (login) and password for your FTP Backup server. Click **OK**. To Schedule Automated Backups in Plesk Click the **Scheduled Backup Settings** icon. Select how often you want to create a backup (daily, weekly, or monthly). Select the location for your backup files. Specify the maximum number of backups. When you reach the maximum number of backups, Plesk will automatically remove the oldest backups. Enter the name the backup files should begin with. Click **OK**.
