Keywords: Assisted Service Plan

Assisted Service Plan covers the following categories of virtual dedicated server functionality: Set up Set up includes initial server configuration, including operating system and control panel installation. Custom system administrative work can be requested at an hourly rate. Advanced server support is available at no charge. Monitoring Monitoring of the system includes the server, network, and any services that reside on the server, including databases, Apache, and IIS. This is accomplished through ping monitors for server and network uptime, and HTTP monitors for Web site uptime. Backup and recovery The server's Plesk configuration and Plesk-related Web site content is backed up daily, with the last seven backups archived. Restores can be done at any time, without charge. Custom backup scripts can be created at an hourly rate. Security scans Security scanning occurs monthly. Each scan produces a report that is viewed by hosting support. A list of corrective actions, if necessary, is compiled and forwarded to you. Anti-virus scanning is also performed on Windows servers, only. Patching Official operating system patches, updates, and bug fixes are applied each Wednesday, starting at 11:00PM MST. If the likelihood of exploitation is high, a patch is applied immediately.
