Keywords: Assisted Service Plan

Assisted Service Plan is a virtual dedicated server option that shifts the responsibility of set up, monitoring, backup, maintenance, security, and patching of your virtual dedicated server to our server support team. With Assisted Service Plan, custom support services are also available for an hourly rate. Assisted Service Plan virtual dedicated servers remove your root/system-level access but allow control over all other aspects of your virtual dedicated server. Assisted Service Plan dedicated servers use Plesk control panel. Windows servers run the Windows Server 2003 Enterprise Edition operating system. Linux servers run Fedora 6, Fedora 7, Cent OS 4 or CentOS 5 operating systems. Assisted Service Plan can be purchased with or added to a virtual dedicated server. For more information, see [What Is Included in Assisted Service Plan?](#) and [What Is Assisted Service Plan for My Dedicated Server?](#).
