Keywords: Assisted Service Plan

Assisted Service Plan is a dedicated server option that shifts the responsibility of set up, monitoring, backup, maintenance, security, and patching of your dedicated server to our server support team. With Assisted Service Plan, custom support services are also available for an hourly rate. Assisted Service Plan dedicated servers remove your root/system-level access but allow control over all other aspects of your dedicated server. Assisted Service Plan dedicated servers use Plesk control panel. Windows servers run the Windows Server 2003 Standard or Web Edition operating systems. Linux servers run Fedora 7, CentOS 4 or CentOS 5 operating systems. Assisted Service Plan can be purchased with or added to a dedicated server. For more information, see [What Is Included in Assisted Service Plan?](#)
