Keywords: CSR

You would generate a Certificate Signing Request (CSR) for your 6-in-1 SSL certificate the same way that you would for a regular SSL certificate. Enter as your certificate's common name, the domain you consider your primary domain. In most cases, this would be the ".com" TLD (www.yourpersonaldomainname.com). However, you may enter any of your TLDs as the primary common name. Once issued, the certificate will enable secure transactions on the primary domain and all of the up to six TLD variations we have validated through our authentication process.
