Keywords: CSR Certification Authority

To obtain an SSL certificate for a Web site hosted on your virtual dedicated server, you must first generate and submit a certificate signing request (CSR) to your Certification Authority (CA). Once the CA has received the CSR, it will process the certificate request and, if the authentication process is successful, issue a signed certificate for your Web site. The CA will provide you with CSR-generation and certificate-installation instructions. Related Information For CSR-generation instructions for Apache 2, IIS, and other Web servers, please visit:
